

PRODUCT DATA SHEET

HUMIDITY INDICATOR CARD

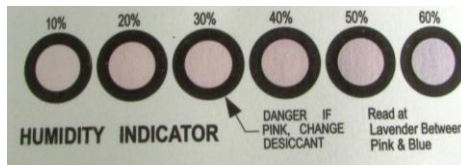

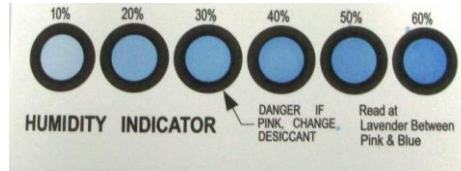

Description and Uses

HUMIDITY INDICATOR CARDS are products that show the amount of moisture in the package precisely by using them together with humidity and environmental conditioner products.

Humidity indicator cards can also be used as a guaranteed control mechanism that the packaged product is protected from external influences during shipment or storage. In addition, during the use of special products sensitive to moisture, it indicates whether the product is exposed to moisture when the package is first opened, thus serving as a guarantee and information mechanism that also shows the product quality.

The humidity indicator feature is recyclable and is designed to show the instant humidity of the environment between 10-60%. The products whose all points turn pink in a high humidity environment may turn pink again to blue when stored in a dried environment with silica gel like humidity adsorber. In addition, it can be reactivated (blue colored) by keeping it in an oven at 110-130°C for 1-2 hours.

We have products that show different moisture ranges depending on application sensitivity.

Transport and Handling

Standard 6-point (10-60% RH) products are sold in airtight aluminum packages of 150 pieces and packed.

General Notes:

The information in these publications reflects our own average findings and comments for our products however the use of the product may vary according to the field of application and the buyer is solely responsible for the application, use and reprocessing of the material.
